Problem Statement

The Problem

Finding sponsors and college delegations for events takes a lot of manual digging. Most contact info online is hidden, outdated, or stuck behind generic inboxes like info@company.com. The task is to build an agent that takes a search prompt, or an uploaded event brochure, does the digging, and hands back verified, structured leads.

What the Agent Has to Do

1. Find leads: turn a search prompt or a PDF brochure into a list of relevant companies or college societies.
2. Name the decision-maker: the actual person in charge (marketing lead, CSR head, society president), not a generic central inbox.
3. Verify the contact: confirm the email or profile link exists and is deliverable. No fake or made-up contacts.
4. Save it automatically: push the clean, structured data straight into a Google Sheet or database. No manual copy-pasting.

Where the Agent Should Look

Company websites and team pages, LinkedIn, Facebook and Instagram pages, college society sites, past sponsor lists, and press coverage. The agent moves across these on its own and keeps going when a page is missing or dead.

The Sheet It Fills

Field	What goes in it
Organization Name	Company or society name.
Category	Sponsor or College Delegation.
Location	City.
Contact Person	Name and role of the decision-maker.
Contact Channel	A real email address or an authentic profile link.
Verification Status	Verified or Pattern-Derived.

How to Submit

- GitHub link: the code, with a short README on how to set it up and run it.
- Demo: a short video or live demo, from prompt to populated sheet.
- Sheet link: a viewable link to the output Google Sheet, with test-run data in it.

Judging: 100 Points

Submissions are tested on fixed prompts plus a sample brochure. Output is checked against the six-field schema, verification is spot-checked, and any invented contact fails the run.

Agent flow & autonomy: searches, follows links, handles dead pages	**40**
Contact accuracy: real, deliverable contacts, no hallucinated data	**30**
Brochure / PDF parsing: extracting targets from an uploaded brochure	**15**
End-to-end pipeline: hands-free, from query to populated sheet	**15**
Total	**100**
